"Structures of five mutants of toxic shock syndrome toxin-1 with reduced bachogical activity";
Biochemistry 37:7104-7202(1998).
-!- FUNCTION: Responsible for the symptoms of toxic shock syndrome.
-!- SUBCELULIAR LOCATION: Secreted.
-!- SUBLIARITY: Belongs to the staphylococcal/streptococcal toxin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TOXIC SHOCK SYNDROME TOXIN-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL, JOZ615; AAA26682.1; -..

"Identification of Mycolasma pirum genes involved in the salvage
pathways for nucleosides.",
J. Bacteriol. 175:5281-5288 (1993).
-!- FUNCTION: THE ENZYMES WHICH CATALYZE THE REVERSIBLE PHOSPHORYLOSIS
OF PYRAMIDINE NUCLEOSIDES ARE INVOLVED IN THE DEGRADATION OF THESE
COMPOUNDS AND IN THEIR UTILIZATION AS CARBON AND ENERGY SOURCES,
OR IN THE RESCUE OF PYRAMIDINE BASES FOR NUCLEOTIDE SYNTHESTS.
-!- CATALYTIC ACTIVITY: Thymidine + phosphate = thymine + 2-deoxy-D-

Indentification of the catalytic triad of the protein D2 protease in Pseudomonas aeruginosa.
Eschem. Biophys. Res. Commun. 247:142-145(1998).
-!- FUNCTION: Porin with a specificity for basic amino acids. Also possesses serine protease activity.
-!- SUBCELLULAR LOCATION: Integral membrane protein. Outer membrane.
                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE FROM N.A., AND SEQUENCE OF 24-40.

INTEGRIN ALPHA-5 HEAVY CHAIN (POTENTIAL).
INTEGRIN ALPHA-5 LIGHT CHAIN (POTENTIAL).
EXTRACELLULAR (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                 Development 17:1239-1249(1993).

-!- FUNCTION: INVEGRIN ALPHA-5/BETA-1 IS A RECEPTOR FOR FIBRONECTIN.

IT RECOGNIZES THE SEQUENCE R-G-D IN ITS LIGANDS.

-!- SUBUNIT: HETERODIMER. OF AN ALPHA AND A BETA SUBUNIT. THE ALPHA SUBUNIT: HETERODIMER. OF AN HEAVY AND A LIGHT CHAIN LINKED BY A DISULFIDE BOND. ALPHA-5 ASSOCIATES WITH BETA-1.

-!- SUBCELLULAR LOCATION: Type I membrane protein.

-!- SIMILARITY: Belongs to the integrin alpha chain family.

-!- SIMILARITY: Contains 7 FG-GAP repeats.
                                                                                                                                                                                                                                                                                     SEQUENCE OF 318-393 FROM N.A.

Mol. Microbiol. 25:329-341(1997).

-!- FUNCTION: Acts as a chaperone (By similarity).

-!- INDUCTION: By heat shock.

-!- SIMILARITY: Belongs to the heat shock protein 70 family.

-!-SUBUNIT: Homodimer. The RNAP catalytic core consists of 2 alpha, 1
-!-SUBUNIT: Homodimer. The RNAP catalytic core consists of 2 alpha, 1
-!-DOMAIN: The N-terminal domain is essential for RNAP assembly and basal transcription, whereas the C-terminal domain is involved in interaction with transcriptional regulators and with upstream promoter elements (By similarity).
-!-SIMILARITY: Belongs to the RNA polymerase alpha chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SEQUENCE FROM N.A.

 cultur (Pe-S) centers, to quinones in the respiratory chain. The immediate electron acceptor for the enzyme in this species is believed to be ubiquinone. Couples the redox reaction to proton translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient.

-!- CATALYTIC ACTIVITY: NADH + quinone = NAD(+) + quinol.

-!- CATALYTIC ACTIVITY: NADH + quinone = NAD(+) + quinol.

-!- SUBUNIT: Composed of 13 different subunits. Subunits nuoCD, E, F, and G constitute the peripheral sector of the complex.

-!- SIMILARITY: In the N-terminal section; belongs to the complex I 30 kba subunit family.

-- SIMILARITY: In the C-terminal section, belongs to the complex I 49 cc. -!- CAUTON: REF. SEGUENCE DIFFERS FROM THAT SHOWN DUE TO A FRAMESHIFT IN POSITION 175.

Dubmitted (MAY-2000) to Swiss-Prot.
-!- FUNCTION: Acts as a chaperone (By similarity).
-!- INDUCTION: By stress conditions e.g. heat shock (By similarity).
-!- SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EMBL; U72721; AAB39223.1; -.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Miner J.H., Lewis R.M., Sanes J.R.;
Submitted (NOV-1997) to the EMBL/GenBank/DDBJ databases.

-!-FUNCTION: Binding to cells via a high affinity receptor, laminin of cells into tissues during embryonic development by interaction of cells into tissues during embryonic development by interacting with other extracellular matrix components.

-!-FUNCTION: ALPHA-5 CHAIN MAY BE THE MAJOR LAMININ ALPHA CHAIN OF ADULT EPITHELIAL AND/OR ENDOTHELIAL BASAL LAMINNAE.

-!-SUBUNIT: Laminin is a complex glycoprotein, consisting of three different polypeptide chains (alpha, beta, gamma), which are bound to each other by disulfide bonds into a cross-shaped molecule comprising one long and three short arms with globules at each
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4 SEEINEKDLRKKSEL--QG----TALGNLKQIYYYNSK--AITSSEKSADQFLTNTLLF

Submitted (DEC-1995) to the EMBL/GenBank/DDBJ databases.
-!- PUNCTION: Induces disassembly of actin filaments in conjunction with ADF/cofilin family proteins. Regulator of actin organization in myofibrils.
-!- SIMILARITY: Belongs to the WD-repeat AIP1 family.
-!- SIMILARITY: Contains 9 WD repeats.
                                                                                                                                                  Ono S.;
"The Caenorhabditis elegans unc-78 gene encodes a homologue actin-interacting protein 1 required for organized assembly actin filaments.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EMBL; AF52447; AAA11613.1; EMBL; U42835, AAA3588.1; ...

RROUX C.R., Martin D., Hamel J., Brodeur B.R.;
"Heat shock protein HSP70 and amino terminus of DnaJ of Streptococcus agalactiae.",
Submitted (SEP-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Acts as a chaperone (By similarity).
-!- INDUCTION: By stress conditions e.g. heat shock (By similarity).
-!- SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               69 VDLGST-AATSEYEGSSVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEKKVPI

-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to the ABC transporter family. Uvra subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Submitted (OCT-1996) to the EMBL/GenBank/DDBJ databases.

Submitted (OCT-1996) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: The UvrABC repair system catalyzes the recognition and processing of DNA lesions. UvrA is an ATPase and a DNA-binding protein. A damage recognition complex compose of 2 uvrA and 2 uvrB subunits scans DNA for abnormalities. When the presence of a lesion has been verified by uvrB, the uvrA molecules dissociate
                                                                                                                                                                                                           01-NOV-1997 (Rel. 35, Created)

J. Suburgation and organization is thought to mediate the attachment, migration and organization of cells into tissues during embryonic development by interacting with other extracellular matrix components.

J. Subunir: Laminin-15 comples is an heterotrimer composed of three chains (alpha-5/Deta-2/Gamma-3) which are bound to each other by disulfide bonds into a cross-shaped molecule comprising one long and three short arms with globules at each end.

J. SUBCELULAR LOCATION: Extracellular; found in the basement membranes (major component).

J. SUBLERINITY: Expressed in heart, lung, kidney, skeletal muscle, pancreas, retina and placenta. Little or no expression in brain and liver.

J. SIMILARITY: Contains 1 laminin N-terminal domain.

J. SIMILARITY: Contains 2 laminin G-like domains.

J. SIMILARITY: Contains 2 laminin G-like domains.

Ady4p and Spocy4p are components of the meiotic spindle pole body
that promote growth of the prospore membrane in Saccharomyces
crevisiae.";
Eukaryot. Cell 2:431-445 (2003).
-!- FUNCTION: Involved in the pathway that organizes the shaping and
sizing of the prospore membrane (PSM) during sporulation. Probable
component of a core structural unit of the scaffold that initiates
synthesis of the prospore membrane.
-!- SUBUNIT: Interacts with itself. Interacts with MPC54, NUD1 and
                                                                                                                                                                                                                                                                                                                                                     of the

"Jonatin structure of the Acetogenium kivui surface layer revealed by electron crystallography and sequence analysis.";

"Jonathy 176:1224-1233(1994)

"FUNCTION: The S-Layer is a paracrystalline mono-layered assembly of proceins which coat the surface of bacteria.

"SUBCELLULIAR LOCATION: Cell wall. This bacterium is covered by a S-layer with hexagonal symmetry.

"PTM: THE CARBOHYDRATE CONTENT OF THIS PROTEIN IS ABOUT 8% WHICH CORRESPOND TO ABOUT 40 TO SO SUGAR MOLECULES PER MONOMER. O-LINKED GLYCANS CONSIST OF GLC, GALMARC AND GLORAC.

"SIMILARITY: Contains 3 S-layer homology (SLH) domains.
                                                                                     STRAIN=DSM 2030; MEDDMed=2681162; MEDINE=90036724; PubMed=2681162; Peters J., Peters M., Lottspeich F., Baumeister W.; S-layer protein gene of Acerogenium kivui: cloning and expression in Escherichia coli and determination of the nucleotide sequence.";

--- PUNCITION: Acts as a chaperone (By similarity).
--- INDUCTION: By stress conditions e.g. heat shock (By similarity).
--- SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rhee D.-K.;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PUNCET. OPHTHAUMOI. VIS. SCI. 38:893-900(1997).

-!- FUNCTION: BINDS TO TYPE I, II, AND IV COLLAGENS. THIS ADHESION PROTEIN MAY PLAY AN IMPORTANT ROLE IN CELL-COLLAGEN INTERACTIONS. IN CARTILAGE, MAY BE INVOLVED IN ENDOCHONDRAL BONE FORWATION. MAY PLAY AN IMPORTANT ROLE IN THE MORPHOGENESIS OF CORNEAL TISSUES.
-!- SUBCELLIAGE LOCATION: Extracellular. MAY be associated both with microfibrils and with the cell surface (By similarity).
-!- TISSUE SPECIFICITY: LOCATED PRIMARILY IN THE EPITHELIUM OF NORMAL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         18; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PHOSPHORYLATION (AUTO-) (BY SIMILARITY)
INDUCTION: By stress conditions e.g. heat shock (By similarity). SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
